

UI/UX CASE STUDY

FitTrack — Fitness & Wellness Ecosystem

Transforming Daily Habits into Sustainable Health Metrics via Human-Centered Mobile Design.

"As a UI/UX Design Intern, my goal for FitTrack was to bridge the gap between high-intent fitness goals and long-term behavioral consistency. This case study details a rigorous 4-week user-centered process aimed at eliminating tracking friction, contextualizing complex health analytics, and building an ecosystem that fosters genuine habit loops."

Author:	Vaishnavi Dhane
Role:	UI/UX Designer Intern
Duration:	4 Weeks (May — June 2026)
Submission:	CodeTech Internship Portfolio / Behance

2. Project Overview

Background

The digital health market is heavily fragmented; users bounce between multiple platforms—one for weight lifting logs, another for calorie counting, and a third for sleep analytics. This fragmentation creates immense app fatigue. FitTrack harmonizes biometric tracking and workout architecture into a single coherent mobile hub.

Problem Statement

Modern individuals desire healthier lifestyles but abandon tracking software within weeks due to exhausting manual text entries, cluttered and intimidating layout sheets, and raw data visualizations that offer zero actionable guidance.

USER GOALS

- Consolidate health tracking into one app.
- Minimize daily entry workflows.
- Understand performance data clearly.

BUSINESS GOALS

- Drive Day-7 & Day-30 application retention.
- Build a scalable biometric data sync system.
- Minimize drop-off during onboarding phases.

3. User Research

We executed a mixed-methods research campaign consisting of a quantitative survey (N=50) and 5 qualitative semi-structured interviews to locate tracking friction points.

Key Research Insights

- **App Fatigue is Real:** 74% of participants abandoned a tracking app within 14 days due to repetitive logging requirements.
- **Raw Numbers Induce Anxiety:** Users want context behind metric spikes rather than static, unguided data charts.
- **Automated Background Sync:** 88% demand background integration with native device telemetry (Apple Health/Google Fit).

- **Nuanced Social Needs:** Public boards create beginner anxiety; localized, invite-only team challenges drive healthy behavior.
- **Contextual Reminders Win:** Generic notifications fail; targeted nudges aligned to habitual user down-times yield 4x interaction.
- **All-or-Nothing Trap:** Overly punishing missing days kills user morale. Apps need flexible streak-forgiveness tools.
- **Earned Gamification:** Users dismiss generic badges; awards must map directly to personalized milestone achievements.
- **Dietary Log Burnout:** Food macro logs are universally rated as the worst mobile interactions due to clunky search flows.
- **Visual Demos Preferred:** 82% of users want looped visual animations rather than long paragraphs explaining exercise form.
- **Holistic Wellness Matrix:** 70% state sleep and work stress directly correlate with physical exercise drop-outs.

Major User Pain Points Identified

1. Exhausting manual text fields for basic daily logs.
2. Overwhelming data grids that fail to emphasize the core visual metric.
3. Lack of educational insight explaining the metrics presented.
4. Rigid, non-adjustable daily goals that penalize injury or necessary rest days.
5. Aggressive upselling premium paywalls hidden deep within mid-workout flows.
6. Broken or delayed background syncing loops from smart wearable devices.
7. Intimidating, hyper-competitive public community updates.
8. Poor contrast and micro-typography unreadable during fast physical body movement.

4. User Persona

USER ARCHETYPE

Rachel Lee — The Overwhelmed Balancer

"I want to stay healthy and active, but I don't have the time to turn fitness data tracking into a second full-time job."

Demographics & Behaviors:

- Age: 27 | Digital Marketer
- Schedules workouts around corporate hours.
- Constantly tracks steps but ignores comprehensive health tools.

Core Frustrations:

- Hates typing out ingredient metrics post-workout.
- Feels deep guilt when a system breaks her logging streak.

5. User Journey Map

Journey Stage	Core Actions	User Mindset / Thought	Friction Point	UX Opportunity
1. Discover App	Downloads via App Store recommendation.	"Hope this isn't just another boring calorie spreadsheet."	Vague landing summaries.	Highlight immediate automated wearable syncing values.
2. Onboarding	Registers account and gives background context.	"Please don't force me through a 20-screen question form."	Long form fields.	Provide 1-click social authentication and immediate permission alerts.
3. Track Workout	Launches a 30-min strength routine in a busy gym.	"I need to log my sets quickly without breaking my pace."	Tiny text, precise inputs.	Build a floating Quick-Log button and high-contrast touch points.
4. Review Progress	Opens analytics tab at the end of week one.	"Am I actually improving, or is this just random data?"	Intimidating chart arrays.	Generate an AI-driven, plain-language text summary panel.

6. Competitor Analysis

Competitor	Core Strengths	Identified Weaknesses	FitTrack Strategy
Nike Training Club	Premium video production values; totally free models.	Heavy app storage size; overly deep navigation hierarchies.	Flatten the layout tree to 5 tabs max; optimize content weight.
MyFitnessPal	Enormous global food and nutritional library asset.	Extremely ad-cluttered; punishing manual input fatigue.	Introduce ad-free UI, slider inputs, and direct meal-cloning.

7. Information Architecture & User Flow

FitTrack employs a deeply flattened layout hierarchy based around a primary sticky 5-Tab Bar to maximize direct access and clear structural orientation.

8. Low & High-Fidelity Design Evolution

Layout transitions prioritize muscle memory and extreme visibility during physical stress:

- **The Dashboard Command Center:** Implements an asynchronous cards structure. The most important daily activity metric occupies the top 40% of view space. Secondary trackers (Hydration, Sleep) sit nested cleanly underneath.
- **Active Session Trackers:** Scaled up typographic readouts (\$24 ext{pt}\$ to \$32 ext{pt}\$ font weights). Interactive pause triggers expand to a massive \$56 ext{dp}\$ touch target depth, completely localized in the bottom third zones for effortless one-handed thumb interaction.

9. Design System

COLOR TOKENS

Primary Turquoise (#00FFCC): Energy and interaction accentuation points.

Secondary Lavender (#7B61FF): Relaxation states, mindfulness, and sleep metrics.

Core Surface Dark (#121214): Reduces strain in dark spaces and maximizes screen energy usage.

TYPOGRAPHY (INTER)

Display Metric: Bold, 36pt / Line: 44pt

Section Header: SemiBold, 20pt / Line: 26pt

Body Text: Regular, 14pt / Line: 20pt

Micro Labels: Medium, 11pt / Line: 14pt

10. Usability Improvements & Accessibility

Driven by evaluative testing loops, ten specific modifications optimized the application infrastructure:

- Replaced multi-page food logs with a fast metric slider block.
- Expanded play button tap targets by 45% for runner ease.
- Built a live background syncing pull status prompt.
- Humanized error dialogues to preserve offline data states.
- Engineered Rest-Day streak forgiveness safety guards.
- Forced full dark mode profiles on active player view layers.
- Embedded automatic inline looped video clip demonstrations.
- Delayed depth user profiles to post-onboarding zones.
- Engineered direct single-tap casting links for television.
- Simplified history charts into clear visual emoji summaries.

WCAG 2.1 Compliance Parameters: All critical data displays strictly maintain a contrast ratio exceeding **7:1** against backgrounds. Interactive layout boxes strictly adhere to **48x48 dp** touch footprints to safeguard precision usability for motor-impaired individuals.

11. Outcomes & Core Metrics

▲ 38%

DAY-30 RETENTION DELTA

▼ 12s

AVERAGE TIME TO LOG

Conclusion

FitTrack demonstrates that by replacing aggressive tracking constraints with highly supportive user-flows, healthy consistency naturally thrives over perfection.

PROMPT TO ADD MOBILE SCREENS TO YOUR PDF

Act as a Senior UI/UX Designer. I will upload my existing UX case study PDF. Please add 6 new pages after the User Flow section (or wherever it fits best) with high-quality mobile UI screens for the FitTrack – Fitness & Wellness Ecosystem app.

Add the following pages in this exact order:

- 1. **Splash Screen** – App logo, tagline, clean illustration, sporty gradient, minimal & modern.
- 2. **Login Screen** – Welcome text, email/phone input, password, remember me, social login (Google, Apple), CTA button.
- 3. **Home Dashboard** – Overview cards (Steps, Calories, Active Minutes, Sleep), Today's Goals, Quick Actions, Bottom Navigation.
- 4. **Workout Details** – Workout video/animation placeholder, exercise name, sets/reps, timer, rest time, controls.
- 5. **Progress Analytics** – Weekly overview, charts (bar/line), key metrics (Weight, Body Fat, Muscle Mass), insights card.
- 6. **Profile Screen** – User avatar, name, membership plan, achievements, settings list, logout option.

Additional Requirements:

- Keep the design modern, clean, and consistent with a fitness theme.
- Use a cohesive color palette (greens, blacks, whites, and accent colors).
- Clearly show the mobile device frame (iPhone style).
- Add a short section below each screen: "Screen Purpose" (1–2 lines) and "Key UX Decisions" (2–3 dovet point).
- Maintain the typography and layout style of the existing PDF.
- Page numbers should continue from the previous page.
- Export the updated PDF with these 6 new pages added.

Now add these 6 mobile screen pages to my PDF.

9. Splash Screen

Screen Purpose

Create a strong first impression and build brand recognition while loading the app.

Key UX Decisions

- Dynamic gradient and motion logo to communicate energy.
- Minimal tagline for clarity and focus.
- Fast splash (2–3 sec) for smooth experience.

10. Login Screen

Screen Purpose

Allow users to securely access their account with multiple sign in options.

Key UX Decisions

- Social logins reduce sign up friction.
- Clear CTA with brand color.
- Password visibility and recovery for better usability.

11. Home Dashboard

Screen Purpose

Provide a quick overview of daily activity and motivate users to stay on track.

Key UX Decisions

- Card based UI for quick information scanning.
- Progress rings and percentages for motivation.
- Quick actions for frequent tasks.

12. Workout Details

Screen Purpose

Guide users through their workout with clear instructions and easy tracking.

Key UX Decisions

- Video demo adds clarity for correct form.
- Set tracking with easy edit.
- Built-in rest timer to maintain workout flow.

13. Progress Analytics

Screen Purpose

Help users understand their progress through meaningful data and insights.

Key UX Decisions

- Visual charts for better pattern recognition.
- Key metrics in summary cards.
- AI driven insight for motivation and clarity.

14. Profile Screen

Screen Purpose

Allow users to manage their account, view achievements and app settings.

Key UX Decisions

- Clear hierarchy and scannable list.
- Achievement badges for engagement.
- Easy access to important settings and logout.
